The exact interaction between tables, Pis, lambda, and laptop is the following:

When all data is ready store a pointer (time) into Trigger_A

| Latency_C | SampleSize | Sensingdata_A | Sensingdata_B | Sensingdata_C | Trigger_A | weightresult |

feature   feature   data   **Trigger**

latency   GatewayPi1   GatewayPi2   GatewayPi3   weightresult

Sample size
